

The Islamic Philosophy of Techno-Social Good

By Amana Raquib, Assistant Professor of Religion and Philosophy, Department of Social Sciences and Liberal Arts, Institute of Business Administration

In this module, Amana Raquib will situate and contextualize the ethical discourse around AI within the larger nexus of technology, society and ethics. Looking at the potential of technology both as an expression of human creativity, and as a means for enabling different visions and versions of societies and individuals that can be shaped through various ethical models informing the technological design and development. On the one hand, she will evaluate the ethical and moral dilemmas through evaluating the overall meaningfulness behind the creation and use of technologies, especially AI, in a late-modern age. She'll then apply the Islamic ethical standards of human well-being (maslaha) and the eventual objective of attaining excellence of human character along with the traditional Islamic hierarchy of necessities, needs and enhancements to look at the role of AI in human life.

Lecture Transcript

0:03 Hello everyone. Ir-Rahman-ir-Rahim. I begin with the name of God, the Beneficent, the Merciful. My name is Dr. Amana Raquib. And I'm here from Karachi, Pakistan. I'm an assistant professor at the Institute of Business Administration - it's a university here in Karachi - and I'm thankful to the organizers who have launched this course, who have asked me to deliver a lecture in the series. I'll be talking to you on the topic of the Islamic Philosophy of Techno-Social Good.

0:40 Let me introduce myself a little more. I completed my doctorate in 2014 from the University of Queensland, in Religious Philosophy and Ethics. My dissertation was titled, "Islamic Ethics of Technology: an objectives' approach". The *maqasid*, this is the Arabic term. It has a history in the Islamic traditional theology and ethics. And ever since I've been working on technology and the Islamic ethics. In 2020, I, along with Dr. Junaid Qadir, received a Facebook research ethics grant in AI research initiative for the Asia Pacific, for the project titled "Culturally informed pro-social AI regulation and persuasion framework". As part of that grant, we did the first international conference on Islamic ethics and AI. It happened in Lahore, Pakistan, not in December 2012, but in December 2021, which was last year. You can find out about it, and all the recorded videos and sessions that took place on this website, the link for which you can see here on the screen. And in these various videos, you will see that there are different intellectuals that are talking about the various dimensions of the questions that ensue from the AI developments. And they're all speaking from the vantage point that is informed by Islamic metaphysics and ethics.

2:35 Recently, a paper got published on this, the title of which was "Islamic virtue-based ethics for artificial intelligence", in the journal *Discover AI*. My book also got published in 2016, based on my PhD research, and interestingly, it is a growing interest in my book, especially with all the new research and development that's

AI ETHICS

taking place in the field of AI. And then also because of a lot of uncertain potential that AI carries for a human future.

3:19 I'll be talking about the Islamic Normative Framework. Now, before embarking on AI particularly, I would like to build upon some of the core ideas, concepts, or what you might call the ethical foundations within the Islamic tradition that have stayed the same throughout the last 15 centuries. Although the manifestation and how they're acted out and lived out, depend on the given circumstances, which might change. But these are the core foundations or ethical principles. Now, yeah, and those fundamental terms I'll be discussing, because later on, I'll be building my case on these. So the first thing here that I'm going to talk about is *ehsan*, which is a set of three things. This is excellence, which is the spiritual model of excellence, and a constant striving for that. And it also entails virtue, or there's also this connotation of a virtuous living, and you know, trying to inculcate as many virtues as possible and try to have a virtuous living. And then especially with regards to a techno-society in which we are living, there is this ingredient of technomoral wisdom, right? *Ehsan* generally contains the idea of wisdom within it because in order to act in a certain situation with the utmost excellence, you need the wisdom to know what is the most appropriate decision, judgment or action in a given situation.

5:35 So, here in this case, having this wisdom of what would constitute an excellent living for a human society would be part of *ehsan*. Then there's this idea of human *fitra* or which is translated as human nature, which is again acquired given nature. And that is also very fundamental, because some of the things that I'll be talking about in a while regarding, you know, how, let's say different AI applications interfere with our ability for compassion or empathy, and we need to understand what constitutes our nature or what makes us human. So, within the Islamic system of belief, we are endowed with a God-given nature and that has the potential for living by or not living by ethical values, but at the same time the *fitra* also has the capacity to not just know, understand and love for, but also the the emotions, the sentiments that we have for other human beings. And so it's a sum total of our rational as well as the faculty of emotions and it has our instincts as well.

7:28 So, what we are given by God. And this concept of *fitra* is important, because within the Islamic system you can only have that genuine living if you are living in accordance to this God-given nature both in the individual capacity as an individual but also as a society, as a collectivity. *Fitra* or human nature is important, because the very idea of a good life within the Islamic system of belief and ethics is defined by what our human nature is. And in order to deem and or a decision or a value to be ethical or unethical, we have to go back to what our nature is. So that nature functions in a way that it can only work properly if it's in the pure state - it's not distorted. And I'll talk about it later, of how living in a world, in a social universe, that's not in accordance with the human nature distorts the nature, and that can cause a number of consequences, including people losing their sanity, in extreme cases, and doing some outright unethical actions.

9:35 So again, a lot of problems that we see in our societies today, I would say that partially they are explained by the fact that human nature does not find its fulfillment in the given dynamics of the society. The next key concept is *mizan* or balance. And that's also related to the earlier two concepts of *ehsan* and *fitra*. *Mizan* is the balance, right? So again, a balance stayed where we are. When we talk about *mizan* a balance within the Islamic system, then it's the balance within the human soul. It's the balance within the social relationships. It's the balance between the human and the nonhuman environment. So a complete state of balance that I'm talking about, and that balance, and that also requires understanding the human position and the human responsibility in maintaining the balance,

AI ETHICS

the original balance that's there in nature, that's instituted by God. So again, one way that people are living at the level of social, moral, spiritual excellence or *ehsan* is that they would be a balanced state of affairs. So human relations wouldn't have discords, they wouldn't be in a disharmony within the human self. There wouldn't be a lot of conflicts amongst human beings. So that's the state of balance right? And if human nature does not find its fulfillment, according to its constitution, or the way it is designed by God, then it goes into disequilibrium or disbalance, and then that disbalance within then is manifested at many other levels on the outside.

12:17 The other important idea that I'll be using is the objectives of the Islamic *Sharia* or Islamic system. And the key objective of the Islamic religion is to have the collective good and welfare of humankind in accordance to the Divine Code or *Sharia*. And in accordance to their essential nature, that is *fitra*, and the various laws and various principles that you would find within Islamic theology, Islamic ethics and Islamic jurisprudence. They are meant to ensure this.

13:13 Now before embarking on discussing the specific AI technology and its repercussions and consequences for human individuals and human societies, I would like to point out the fact that we need to discuss technology as such before we can talk about a particular technology. The reason being that we have to decide whether we are looking at, for that matter at any technology, as means or as the ultimate end or objective, right? It is important to be clear on this since if technology is a means to reach a certain conception of life, then the standard of the good life should be meta-technological, and technological design and development should follow from there. You know, there should be some meta-prescription that would set the standard of the good life, and the technology and the design and development of any given technology should be subservient to that. If on the other hand, technology acquires the status of an end, then the good life gets defined in terms of technological efficiency, and then there won't be a meta-technological standard to gauge, to evaluate any given technology, because technology itself would become the standard. This is important, and I'll be using this later in my talk.

15:06 Now, the next question that arises with regards to the modern technology is whether technology or techne itself is the *telos* or the purpose. Now, this is not just a practical or social question, rather this is a metaphysical question regarding, you know, because if we have to decide what is a good life or what is the good life for human beings, then that requires us to first answer or first delve into the nature and purpose of human beings, as such. So, technological practices are not just cultural practices, but rather they exhibit the way the world is meaningfully or meaninglessly created and shaped by humans. So, they represent what human beings consider to be meaningful, what human beings consider to be the good in their collective lives, as well as their in their individual lives. So this question of *telos* or purpose is very important, and this is related to the earlier distinction that I talked about between the means and the end. So here again, whether there's some other purpose that can set the place of any technology or is technology itself the purpose right, as I said earlier, the end in itself.

17:09 Again, we see that there are philosophers and sociologists of technology, who talk about the technical code or script. So they say that the technological artifacts are understood as inscribed with meaning and value, which are the results of the negotiation process that occurs in the design process and at the stage of implementation by users. Technologies are seen as containing a script that delegates specific responsibilities and actions to the users. If this is the case, then it's not something that's just there and people can use them according to their tastes and preferences. We know that it makes people behave and act in certain manners. So for example, the possibility of checking out our various digital networking platforms for news updates or social messages. It encumbers both the

AI ETHICS

sender and receiver of the messages, because they start considering them responsible for checking and updating the messages very frequently and if they don't do so, the people would consider them as inconsiderate.

18:36 So again, those are the expectations that are generated and the behavior that becomes the expected behavior and the norm because of that script that is there, that emphasis in the technology. So that again, makes us think that once they are being designed, you are not just designing a technology you're actually designing and shaping the way people will be behaving in future once that technology gets adopted, the whole societies adapt to that technology. And the status to the fact that there are, again, normative biases in any technology, right? So that, you know, that's an extension of the script that we were talking about - that there are normative biases, right? Of what would become acceptable, what would be considered good, right? So again, if you're talking about, you know, checking out the news, the more recent news every now and then and responding to a comment, is it a good thing? But it depends on whether you are able to have those frequent news updates or not, right? So in a way, if that possibility is opened, then it becomes almost compulsory for people to have themselves updated on it, every now and then. So in that sense, that technology, it creates an agenda of its own. And in Postman's words, "It's a metaphor waiting to unfold".

20:42 So again, so those normative vices, again, it's not that somebody, sometimes it could be very deliberate but even if it's not deliberate, you never create anything and presuppose or assume it's in a vacuum, right? So instead, they proceed out of our whole human experience and they are directed by our ultimate commitments. So if you are creating something, for instance, somebody had a vision that everybody had their personal PCs, or laptops or smartphones, for instance, then you're thinking about imagining a certain life for people, and certain ways that their socialization will take place, certain ways things would function. So again, it's a new way of life that you are thinking, when you are developing these things, and that is why they have those far reaching effects and impact. Another thing that we need to talk about and we need to discuss when we are talking about technology is the idea of progress, because as we talked about earlier, about the good life, then, if we look at the the modern understanding of a good life, most often than not, it cannot be decoupled from the idea of progress.

22:22 Now, there's a difference between the early modern understanding and appraisal of this idea of progress with what we witness in this period, which we might call late modern or postmodern period. Now, the modern idea of progress is based on humanistic ideals, and there is this idea that there will be a betterment of the human condition through the use of technology. Now, this is not tenable anymore, after the crisis that's been witnessed in the 20th and 21st centuries and crisis of all sorts, right? It's not just the technological warfare, but lots of other things like mental health disorders and other things that impact social harmony and so on and so forth. But then, the idea of progress is seriously under attack, and now we are living in a world that's bereft of that vision of the humanist vision of progress. And the postmodern formula of finding good, the only constant is change. The change is there, if you change for the sake of change, or other innovation for the sake of innovation, you know? You won't ask what this innovation for that matter is doing to human lives or societies either for the better or to its worst. You don't need that explanation or justification anymore, because now there's no fixed way of looking at human progress. Because of this very shifting understanding within this milieu, we see that innovation becomes eventually a final good. And as I'll explain that this is the key to understanding the many problems that we witness today.

AI ETHICS

24:36 So, because we are living in this age of radical plasticity, which is like a *telos* of *no telos*, this is very relevant quote. It says, “The pervasive materialism and violence of late modernity stems from its inability to embrace fully a world purged of any purpose and permanence, and therefore any resulting providential or progressive trajectories. The rapid development of various technologies merely amplifies the predicament...A postmodern telos of no telos offers modernity a way out of its dilemma...The radical plasticity of the postmodern orientation is attained because its telos is also its techne...The postmodern telos of no telos is in fact a telos of techne”. So now that you don't have any metaphysical foundation to ground, any permanent fixed kind of ethics, so in that vacuum, the gap that's created you cannot live with that, and therefore, technology was the most likely candidate to take over. So it becomes the final purpose or the ultimate purpose. So you don't have a pre technological understanding of what the good life is. And then you would create certain technologies to serve that conception of a good life. Instead, just excelling in technology becomes the good life. So this is kind of the gist of what this quote intends to say.

26:15 And when you don't have defined, well defined ends, then there is an indifference to ends. So you are looking at workability, you are looking at efficiency, but not to certain answer objectives. So development of technology becomes for the sake of technology, and then the technological means because you don't have any goals or ends where you have to serve those ends, then the means would be indefinite, because usually the means are, the number of means are curtailed or ordered, or informed by the number and the kinds of ends that they are meant to serve. If there are no ends on which we have an ethical consensus, then this will become, you know, a multiplication of means, you know, ad infinitum. And the morality also becomes the morality of means, rather than morality. And so you again, would look at things like efficiency and convenience, which are means, which cannot be the final ends. And then you celebrate creativity and innovation without purpose, which is symptomatic of nihilism in a way.

27:37 And it's not just the social purposes and goals that get changed in the process. But then also, eventually, you even have to redefine human beings ontologically. And so technology serves human needs, while also creating the needs that the sort of human beings create technologies. And those things shape what it means to be human. So again, for instance, some of the technologies that allow us, you know, the very technology that I'm using to communicating to people whom I don't even know, who will be listening to this lecture, what would be the background of that person, and that person would perhaps might never get to see me and talk to me in person. And I believe, and I'm considering this to be a communication, right. So that would require me to rethink of ways of communicating between humans which would in turn mean, you know, what we consider human interaction to be. So again, it has those ontological definitions that take place. And then the ontological question also pertains to defining human beings as to whether we are the fabricating beings, right? Is that our defining quality or feature? If we are homo fabers, right? So, do we constantly fabricate ourselves or do we define ourselves as spiritual-moral-social selves? As I talked about earlier that within the Islamic schema, human beings are spiritual-moral-social beings.

29:25 The next thing that I'll be talking about is the axiological side of technology, right. So, technologies developing within a specific cultural context, embody a specific set of meanings, functions, values and vision for the society. These may prevent certain other values from becoming functional or operational, right? So, they would encourage certain values and discourage the others. So, the question that we need to ask is does this good life need to be technological? Is that the prescription for a good life? And is self realization equivalent to

AI ETHICS

technological consumption? Is collective human prosperity and well being equal to technological consumption? So, problems could only be the ones that can be solved via technology now, right. Again so, the very way we define and understand problems is now also understood through technology, right. So, only those things are to be considered problems that could have technological solutions. And then that becomes the focal point, right. I'll be talking about, I've given here the example of driverless cars, and I'll be talking about it in a while.

30:57 Now, regarding technology and reality. So technology changes the social understandings and practices. So, for instance, sonography of human fetuses changes social understanding, and along with the medical practices with respect to expecting mothers and developing fetuses. Infertility, before the advent of IVF, was not considered a disease but a social situation of not having children. Now it's a medical condition that it was a technofix. The instrumentalist worldview is invading our spirit and influencing the way we teach and learn and manage our social institutions. A calculus of averages and probabilities is replacing ends and the common good. The technological order is reconstituting the moral order in terms of technique.

31:52 Now if we contrast the postmodern reality with the Islamic reality, and what's the salient points that we see? Postmodernism is modernism stripped of teleology, the modernist faith in progress has been undermined in the postmodern world. Yet the drive to innovate that fired the engines of progress has been intensified and accelerated. Innovation now constitutes an end in itself, unencumbered with the baggage of final purposes. ultimate goals or cosmic designs for mankind. Now contrastingly, in Islamic reality, the human self and values both have absolute dimensions. Certain meanings cannot be indefinitely constructed and reconstructed. The idea of human nature *fitra* is central, which is fixed, which is permanent, which is essential. The social-ethical values are inferred from the scriptures, which is the Quran and the sayings of the Prophet Muhammad, which is called the Sunnah. And they're also the fixed sources. And then there is a demarcation between substantive and instrumental work. And instrumental work only becomes instrumental, and technology would come under the umbrella of instrumental work, if it serves those substantive goods that are to be derived from the Islamic scriptures.

33:19 Now within the Islamic ethical paradigm, the purpose or objective is to perfect the human character in accordance with the God-given nature. And this process is called *tazkiyah*, which is the highest goal and highest achievement for a human being. This is the unwavering standard against which all techno-social development is to be judged or measured. Rationale of material and technological development is the uplifting of human soul or moral progress so they can actualize their humaneness in terms of reaching the heights of moral-spiritual excellence or *ehsaan*. In this context, the greatest misery according to the Quran is not knowing their true nature and reality of the soul. The greatest transgression or *zulm* in Islamic cosmology is the oppression directed to one's own self.

34:19 So keeping in mind the above cosmology, there are complex, there are complete set of responsibilities that allow a Muslim the character making by the cultivation of virtues whereby fulfilling the responsibilities to God, to other human beings such as their family, including their parents, spouse, children, grandchildren, siblings, uncles, aunts, neighbors, community members, oppressed individuals, weak and needy individuals and so on. And the natural environment like air, water, soil, plants, animals and so on. Here, in the Islamic paradigm, efficiency is not the final value or arbiter. There could be less efficiency if it results in more piety and virtue. Unlike the

AI ETHICS

technologic, where the content of the choices made under the rule of efficiency is less important. Whereas the rule of efficiency is more important. So we see this contrast here.

35:26 Now, if we talk about the Islamic techno-ethics, it's kind of following up on the essential concepts that we just looked at. So within the Islamic paradigm, spiritual-moral contemplation (or *tafakkur*) and teleological thinking (*tadabbur*) leads to self-awareness and God-consciousness, both of which are related. In the Islamic social universe, any technology requires a meta-technological principle for its purpose and validation. No technology is self-justicatory. Practical moral reasoning in the light of objectives of Shariah overrides the technological rationale. Each human activity, technological and non-technological should contribute to this directly or indirectly. So in that regard, technology is not essentially different from other human activities, because they all are guided and steered by those overriding objectives. They are four C's, which are compassion, community building, care and cooperation that undergird all of the social practices in Islam.

36:49 Now, when we talk about the objectives in Islam, the ones that I talked about, so there's this greater goal, which is self-purification, and God-consciousness, as you can see at the top, and then there are those five objectives. And as you can see, these objectives are: religion, life, intellect, property and lineage. But then as you can see, under each category, there are further subsets right. So if we are talking about intellect, then the goal is to have, you know, to facilitate intellect, to foster intellect and thinking, and thereby, you know, the creativity, innovation and novelty that's part of human nature or human *fitra*. Then there's also this objective of respecting the environment or, you know, making an effort towards sustainable living, right. So again, these all have to be balanced. There has to be a *mizan* that should balance all of that. So again, if we are having a technology that harms any of these objectives, such as those of justice, or such as that of human dignity, or kinship, or it in any way causes tyranny, or hampers sustainability, then it has to be seen that, you know that it's not conducive, and it's not aligned to these Islamic objectives, right. So we have to place it within each of these categories and then assess it. So these are those fundamental foundational objectives. Again, there's a consensus on these five objectives, the detailed objectives that you can see here. They are my rendition or my understanding. But that's a proposal to see that how in a contemporary technological world we can understand and apply these five classical objectives.

39:33 So now, finally, now that we have understood technology as an enterprise, modern technology, and then also the Islamic ethics, I'll look at the AI through the lens of Islamic techno-social good. So the main points are that it's the human beings who need to strive to rise above their biases in the quest for living by truth and justice. Virtuous societies do not just need efficient, unbiased, for instance, court trials, virtuous human society more than anything else, need better human beings in pursuit of and exhibiting higher moral ideals. Having a community of virtuous individuals would make the need for many AI applications, especially those that are aimed to substitute human services redundant. In order to improve morally there will be strong social bonds, mutual cooperation and compassion within the communities. So most of the people, they would need, you know, a smart machine to take care of them when they're sick because the community bonds are lacking in the first place. So again, there are non technological fixes, and which as I mentioned earlier, are more in harmony with how human nature has been designed by God.

41:02 Again, norms and virtues So, virtues usually we associate to individuals, whereas norms are more societal. So the Islamic normative framework allows an evaluation, arbitration and determination of a set of collective

AI ETHICS

values that are objective. The individual virtues grow in directions that foster those values. The virtues, once firmly instilled, allow techno moral choices to be made as individuals, and as individual users and as collective units of designers, developers, academics and policymakers. Without the normative framework of values that act as a regulatory framework, the virtues remain too individual to be able to consciously contribute to the creation of right AI policies for creating harmonious societies globally. We are in dire need of intra and inter harmonious communities globally working toward common good and well being, while benefiting from their culture particularities.

42:07 What would be the ethical objectives or the techno moral objectives from Islamic perspective? So the techno moral virtues required for techno moral wisdom can be appropriated from within the *maqāsid* objectives framework. The ethical values in the form of Islamic objectives help in the virtuous character making of the society members. These virtues then enable them to build a techno moral society as they live by those values and integrate those in their individual and collective choices. The Islamic objectives of the Sharia and the general virtues that overlap in this proposed scheme, with the techno moral virtues becoming a subset of both. The kind of subjectivity to be formed through this process would allow the subjects to exercise enhanced moral practical reasoning. So the virtues inform their moral decisions and not only the capacity of users, but also the capacity of designers and engineers. So they can sort of foresee, or have this foresight of what kind of society, the kind of technology they're developing, which creates. And whether they want that sort of a society or not.

43:25 So Islamic virtue cum objectives based system, in that ethics is given a central stage in the individual's private life, whereby an individual's ethical choices shape the society they live in. In return, the society shapes the individual's ethical choices, so there's a constant overlap and back and forth movement. This continuous feedback mechanism ensures that the private individual is intimately tied to the social, whereby the individual becomes the social.

43:55 Now, here is this one case of automated vehicles and accidents viewed through the Islamic normative system that we have been discussing. So we do not know with certainty if self-driven cars will cause less or more accidents now, even if hypothetically, they minimize accidents. Now, the ethical goal here does not only pertain to minimizing the accidents, the greater goal is to inculcate responsibility and empathy, which is virtue in the drivers and the whole system. And this is the social-moral good for the healthy functioning of any society. So, if we do not morally train these drivers, then the automated cars might prevent road accidents and accidental deaths that take place, but not the deaths or the harm that these same individuals cause due to their intemperance or rage. So, they might not get the chance to show that rage on the roads, so this could happen elsewhere. So the question would be if in the capacity of a son or a husband, they actually harmed someone, then should that also be replaced by an automated system or a smart machine, you know? Those relationships, should they be taken over as well? Then we'll have to go back and revisit the idea of human nature.

45:22 So they're not really value-neutral. Any technology, including AI, prioritizes some values over others, such as efficiency over the self reflection or self control, right as we saw in the example. Now, the question that arises is: can machines taking care of sentient beings be socially beneficial? What kind of the prior socio economic moral landscape would lead to the need for this kind of automated care? So not only asking the consequences this would have but also why would you need such a, you know, a caring bot in the first place? In what ways, this in turn, affects the development of virtues on an individual level and human well-being on a collective scale? How

AI ETHICS

can we determine whether human or mechanical care is superior, since this would depend on the virtues and values we prioritize informed by our understanding of human well being aligned with human nature?

46:21 There's also this conflict of control versus character. So AI comes with the promise of increasing efficiency, and unprecedentedly increasing our human control, which has also resulted in AI applications detaching the humane component from human societies. So why does one need to have control, and to what extent are human beings supposed to wield such control over their lives? Experiencing losses, bearing pain and suffering, having time alone for introspection are all part of our human condition that aid us in moral development, growth and character building. If you depute valuable, virtue-instilling tasks to intelligent machines, this marks the dichotomy between ease via efficiency and character making via difficulties and challenges. Again, there's this question or dilemma of moral agency, because if we compare human beings with these smart machines, then let's say this automated diagnosis, it makes the process more efficient, that is diseases are diagnosed more quickly. However, in a scenario where a certain diagnosis goes wrong, and an individual's life is put at risk, then the stress causes harm to the objective of life, which is the central objective in Islamic jurisprudence and Islamic ethics.

47:45 Now the question would be who bears the moral responsibility in this case? Doctors are bound to be morally accountable to themselves and to the society for their negligence unlike robots. Likewise, if automated vehicles cause an accident, they cannot experience remorse or guilt or the sense of responsibility toward the accidents since they are not sentient. If human soldiers fight in a battle, they can be heroes if they treat the populace with dignity or villains if they commit massacres and atrocities. But can robot soldiers be heroes or villains? That's the question.

48:17 So the conclusion is that I aimed to provide a virtue theory grounded in a foundational, yet broad, normative framework of the Islamic objectives, rationally derived from the inductive reading of the Islamic scriptural sources (Quran and Sunna). When we conceptualize virtue-based ethics within the Islamic tradition, we mean an ethical framework to settle the hierarchy of values within the social realm that is then concretized by a societal mechanism of inculcating virtues within individuals resulting in virtuous collectivities, who can uphold the Islamic ethical objectives in their individual and collective lives. What exactly are the values that AI technology needs to seek, in the social realm, that the designers, developers, engineers, policy makers and users can then translate into actions through their virtuous dispositions? The cultivation of virtues, agreed upon by the major religious and secular ethical traditions, could be integrated within the broad umbrella of Islamic objectives specifically under the religious objective of *tazkiyah*, which is self-purification or self-actualization. Thank you very much. And I hope that this course was fruitful, and many people are able to benefit from it. Thank you very much.
